## Abstract of disclosure

There is provided a method for producing Lleucine using bacterium belonging to the genus

Escherichia, which produces L-valine, Lisoleucine and L-homoleucine in an amount of less
than 1% of that of L-leucine produced due to
inactivation of ilvE gene coding for branched
chain amino acid transaminase and produces
increased amount of L-leucine due to increasing
the activity of the aromatic amino acid
transaminase encoded by tyrB gene.
